

Wisemo Release Note

Android Host

Build : 2018-114

Release

Product:	Android Host
Version:	17
Build:	2018-114
Shipping from:	03.05.2018
Release Type:	New build

Introduction

This is a build update to version 17. It contains bug fixes and enhancements. For perpetual licensed users, a new license key is not needed.

New features and enhancements

- When using the logging feature, the events are stored to a file. The file name has changed from WiseMoHost.log to WiseMoHostEvent.log.
- The Write Log function has changed name to Support log. It creates a low-level log that WiseMo support may ask the user to send – to help us better troubleshoot a reported issue.
- Android permit use of non-latin characters as bluetooth name. Host now support a non-latin bluetooth name as Host ID.
- The Help Invite feature is now enabled as default, to ease the use of this method for providing access.
- Add-on component support made for various devices, including Panasonic, ProDVX, PointMobile, Crosscall M1, Athesi, Huawei, e.g. P8.

Bugs fixed

- End-process execution, e.g. via the Remote Management feature, is not possible. Now a more correct error message is returned, if end-process is attempted.
- Launch of a task on the Android device via the Remote Management interface did not work, if the package-name method was used.
